The Company

Hundreds of tonnes of clothing are collected from around the country by local teams of collectors. The donated clothing is then transported to a processing and distribution centre where it is sorted and non-clothing items and waste are removed.

When the clothing has been sorted it is available to customers around the country to sell as clothing bank original mixed clothing.

The Need

The Clothing Collection Company needed:
- To be able to track the collections that were made around the country from clothing banks and from door-to-door collections.
- To be able to track times spent at each site.
- To automatically send data to head office.
- To record correctly the quantity of products collected and sent to processing.

The Solution

A van collection module was written for the clothing collection company which allowed them to keep track of the items that were collected which fulfilled the needs. The system has been rolled out to all collectors (100). The data is then processed in ‘real time’ so that they now know exactly what is happening.
